Personal Information:

- Role: Third-year student | Backend software developer
- Full name: Trần Quang Dũng
- Email: dungtranquang2005@gmail.com
- Location: Hoc Mon, Ho Chi Minh city, VietNam.
- Age: 21.
- GitHub's account: https://github.com/dungtq2k5

Professional Summary:

*"Third-year IT student at Sài Gòn University with proficiency in JavaScript, TypeScript, and the MERN stack. Aspiring **Fullstack Developer** with a deep interest in building practical web and app solutions that **integrate AI technologies**. Proven ability to develop end-to-end e-commerce platforms and committed to applying technical logic to solve real-world system challenges."*

Technical Skills:

- Programming: TypeScript (proficient), JavaScript (HTML - CSS), C++, Java, PHP.
- Web Development: Node.js, Express.js, React, HTML5, CSS3, Bootstrap.
- Databases: MongoDB, MySQL, PostgreSQL.
- Other technologies: Git, GitHub, Postman, Stripe...

Soft Skills:

- Well communication, patience, problem-solving, simplifying technical concepts.
- High critical and logical thinking.
- English communication at the intermediate level, good reading comprehension.

Education:

- Sài Gòn University (SGU) | Expected graduation in 2027.
- Current GPA: 3.03 (average).
- Relevant Coursework:
    - **Data Structures & Algorithms:** Proficient in implementing core algorithms (Sorting, Searching, Dynamic Programming) from scratch using C++ and JavaScript to optimize system performance.
    - **Web Development & Databases:** Hands-on experience building full-stack applications with **Node.js, React, and MongoDB**, focusing on translating business logic into functional code.
    - **Object-Oriented Programming (OOP):** Applied design patterns to create scalable and maintainable software architectures.

- **Artificial Intelligence Fundamentals:** Strong understanding of logic-based problem solving and data processing, with a focus on integrating AI models into web/app environments.

Projects:

E-commerce Platform: Smartwatch Retailer (MERN Stack) | *Jul 2025 – Present*

- **System Architecture:** Architected a high-fidelity e-commerce system using **Node.js, Express.js, and MongoDB**, ensuring robust backend performance and scalable API design.
- **Security & Logic:** Implemented secure user authentication using **JWT/Refresh Tokens** and structured a complex **RBAC (Role-Based Access Control)** system to strictly manage buyer versus admin permissions.
- **Feature Implementation:** Developed advanced features such as dynamic search filtering and real-time shopping cart calculations, utilizing **React and Bootstrap** for a seamless and responsive user interface.
- **About The Project:** A comprehensive MERN stack e-commerce platform designed to be as close to reality as possible. The system features advanced security (JWT/RBAC), scalable API architecture, and a seamless React frontend, simulating a true production-ready environment.

Fullstack E-commerce System: Smartwatch Sales | *Feb 2025 – May 2025*

- **System Development:** Built a complete end-to-end web application using **PHP, HTML5, CSS3, Vanilla JavaScript and MySQL**, focusing on relational database integrity and server-side logic optimization.
- **Security & Logic:** Successfully implemented **JWT-based authentication** and integrated **RBAC (Role-Based Access Control)** to secure the admin dashboard and manage inventory data effectively.
- **Frontend Integration:** Utilized **jQuery and Bootstrap** to enhance frontend interactivity, ensuring a responsive design and smooth user experience across devices.
- **About The Project:** A fully functional e-commerce site that handles the core 'must-haves' of online retail - authentication, inventory management, and CRUD operations.

Frontend Smartphone Storefront | *Oct 2024 – Dec 2024*

- **Frontend Architecture:** Designed functional buyer and admin interfaces using **HTML5, CSS3, and Vanilla JavaScript**, focusing on clean code, DOM manipulation, and event handling.
- **Data Logic:** Engineered a simulation of backend persistence using **Local Storage**, allowing for complex data retention (such as cart state) across browser sessions without a traditional database.
- **User Interface:** Built a responsive layout from scratch without frameworks, ensuring accessibility and visual consistency across different viewports.
- **About The Project:** Built entirely with HTML, CSS, and Vanilla JavaScript. Replicate the basic, 'must-haves' functionalities and features of a dynamic store without a backend by using Local Storage to simulate a database and manually manipulating the DOM.
